Add 12.5 GS/s mixed-signal capability at any time with the HDA125 high-speed digital analyzer

The LabMaster 10 Zi-A series of real-time oscilloscopes boasts the world's highest bandwidth and fastest sampling rate at 100 GHz and 240 GS/s. This world-leading performance is key to acquiring, analyzing and understanding the fastest phenomena found in R&D labs, where engineers are working on next-generation communication systems, high bandwidth electrical components and fundamental scientific research.

The Fastest Oscilloscope for the Most Demanding Signals

Whether working on communications technology capable of terabit/s symbol rates, analyzing the quickest and most energetic laser pulses, or building links using high speed NRZ or PAM4 technologies, the LabMaster 10 Zi-A is the ideal tool for acquiring, displaying and analyzing the highest-bandwidth electrical signals.

For more channels at the highest bandwidths, multiple LabMaster acquisition modules can be combined with one Master Control Module to build a system of up to 80 channels at 36 GHz, 40 channels at 65 GHz, or even 20 channels at 100 GHz. ChannelSync technology ensures precise timing synchronization by design - channel-to-channel jitter of only 130 fs exceeds the performance of "single-box" systems.

Sophisticated Software for Sophisticated Analysis

The LabMaster 10 Zi-A Series offers an extensive set of standard math tools and add-on software packages that integrate seamlessly into the oscilloscope "MAUI" interface. LabMaster 10 Zi-A oscilloscopes excel at performing in-depth analysis of complicated signals. For NRZ signals, the SDAIII-CompleteLinQ package compares eye, jitter and noise on up to four lanes, simultaneously. The Optical-LinQ package simplifies analysis of coherent optical signals such as DP-QPSK and DP-16QAM. PAM4 Signal Analysis enables the industry's only true eye, jitter and noise measurements on PAM4 signals. Since leading-edge technologies often require custom analysis, LabMaster 10 Zi-A also comes standard with the ability to run MATLAB scripts in-stream.

World's Highest Bandwidth Real-Time Oscilloscope

The LabMaster 10 Zi-A modular oscilloscope breaks bandwidth, sample rate, and channel count barriers, providing more “bandwidth density” than any other oscilloscope. Its modular design provides the simplest upgrade path in bandwidth and number of channels. In one acquisition module, it provides four channels at 36 GHz with the ability to expand to 20 modules, for 80 channels of simultaneous acquisition.

Performance across multiple modules is guaranteed with ChannelSync, which ensures precise synchronization of all channels in all acquisition modules using a single distributed 10 GHz clock and a single trigger circuit. Synchronization is identical to that provided with a single oscilloscope, $<130\text{fs}_{\text{rms}}$ jitter between all channels.

The modular design means the LabMaster 10 Zi-A is future proof and upgrading is easy. Start with one acquisition module and add more channels or higher bandwidth modules later as needed.

No bitrate or symbol rate is too high for the LabMaster 10 Zi-A, with its industry-leading bandwidth and sample rate. LabMaster 10 Zi-A is perfect for 10-16 Gb/s technologies such as 40/100 GBASE-R Ethernet, SAS12, and PCI Express Gen4 that benefit from 80 GS/s on four or more channels at up to 36 GHz. Ultra-high speed technologies, such as CEI-25/28, CEI-56, and coherent optical formats including DP-QPSK, 16-QAM, MIMO benefit from 65 or 100 GHz bandwidths and four or more channels.

FASTEST DIGITIZER FOR THE FASTEST SIGNALS

For over 30 years, Teledyne LeCroy has consistently shown industry leadership by pushing forward the limits of oscilloscope performance and waveshape analysis. The LabMaster 10 Zi-A continues this tradition of engineering excellence, incorporating custom chip design and patented innovations to reach unprecedented digitization performance: 100 GHz bandwidth and 240 GS/s sample rate.

Capturing and Characterizing the Fastest Phenomena

Scientific research of phenomena that occur at the shortest timescales require the fastest digitization speeds. At 240 GS/s, samples are acquired at time intervals of 4.17 ps, 50% faster than the next-fastest digitizer, yielding excellent signal reconstruction. For applications and experiments requiring multiple channels, the patented ChannelSync architecture

I & Q components from 160 GBaud QPSK signals are captured by a two-channel LabMaster 10-100Zi-A oscilloscope.

Acquisition and analysis of femtosecond laser pulse by LabMaster 10-100Zi-A.

provides unrivaled matching between channels: less than 130 fs channel-to-channel jitter. Such precision is not possible with conventional methods of synchronizing two independent oscilloscopes. This synchronization is key for applications requiring closely matched channels, such as optical modulation analysis.

Custom Chip Design

The LabMaster 10 Zi-A acquisition system utilizes multiple custom monolithic ICs, including designs for the track & hold, analog-to-digital converters and fast acquisition memory. These designs are at the heart of our industry-leading 4 channel 36 GHz, 80 GS/s design. No other 4-channel oscilloscope on the market achieves 36 GHz bandwidth.

Digital Bandwidth Interleaving

Digital Bandwidth Interleaving uses high-precision diplexers and mixers to split the input signal into separate 36 GHz bands for digitization, and recombines them to achieve record breaking bandwidths. DBI technology, first used in 2005, is now in its 8th generation in the LabMaster 10-100Zi-A, where it is almost triples the 36 GHz ADC bandwidth to 100 GHz. In the LabMaster 10-65Zi-A, DBI is used in a doubler configuration to achieve 65 GHz bandwidth.

ENABLING HIGH-SPEED SERDES DEVELOPMENTS

LabMaster 10 Zi-A is uniquely suited to the demands of high-speed SerDes characterization. For differential signalling requirements, the LabMaster 10-65Zi-A provides two channels at 65 GHz, and accurately characterizes 28 – 32 Gb/s signals. Oscilloscope risetime_{20 – 80%} is an impressive 4.9 ps, a necessary speed when the unit interval (UI) is a mere 36 ps wide (or less). The 1024 Mpts/Ch acquisition memory provides the ability to capture very long waveforms, permitting deterministic jitter (Dj) decomposition on long patterns – something not possible in a sampling oscilloscope. Two input channels provides the ability to input a differential signal pair into the oscilloscope, eliminating the bandwidth, noise, and accuracy constraints inherent in a separate, external differential amplifier.

Multiple Configurations Provide Flexibility

In addition to 2 channels at 65 GHz, a LabMaster 10-65Zi-A system will also provide 4 channels at 36 GHz for testing and debugging of multiple lanes at lower bandwidth. This can be especially useful for crosstalk analysis or lane skew testing when multiple lanes are deployed. Thus, a 65 GHz LabMaster can be deployed in a variety of ways and serve many important application needs in the same lab. For the fastest digitization possible, use the 100 GHz LabMaster 10-100Zi-A acquisition module. Multiple MCM-Zi-A Master Control Modules and Acquisition Modules can even be mixed and matched as needs change.

Superior Serial Data/Crosstalk Analysis and Debug Tools

Teledyne LeCroy's SDAIII-CompleteLinQ Serial Data and Crosstalk Analysis products provide unique capability to simultaneously calculate, display and compare eye diagrams, jitter and noise measurements from four separate lanes or one lane probed or modeled in four different locations. EyeDoctorII and VirtualProbe tools use S-parameters to de-embed/emulate fixtures and interconnects and show you the signal where you can't put a probe. Use the optional 14.1 Gb/s true-hardware serial trigger for capturing rare events. A variety of serial decode annotations are available for common encoding schemes, as well as serial protocols. Teledyne LeCroy's combination of serial decoders and ProtoSync™ protocol analysis views permits link layer debugging on initial SerDes transmissions before protocol analyzer hardware is typically available.

SDAIII-CompleteLinQ SERIAL DATA ANALYSIS PRODUCTS

The Teledyne LeCroy SDAIII-CompleteLinQ Serial Data Analysis products contain multi-lane eye and jitter analysis, LaneScape™ comparison modes, vertical noise measurements, and crosstalk analysis tools. These capabilities provide the deepest insight into the behavior of multi- or single-lane serial data systems.

SDAIII Core Toolset

Teledyne LeCroy provides the most complete toolset in the industry for jitter measurements and eye diagram/jitter analysis. Rj and Dj are separated and Dj is decomposed using one of three dual-Dirac algorithms. Eye diagrams containing all acquired unit intervals are rendered 10-100x faster than competitive systems. Eye diagram analysis tools, such as the extrapolated IsoBER plot, aid insight. Multiple additional tools, such as Tracks, Histograms, and Spectrum waveforms, enhance the understanding of jitter causes. Sophisticated pattern analysis tools, such as Intersymbol Interference (ISI) measurements and plots, provide deep insight into Data Dependent Jitter (DDj) behavior.

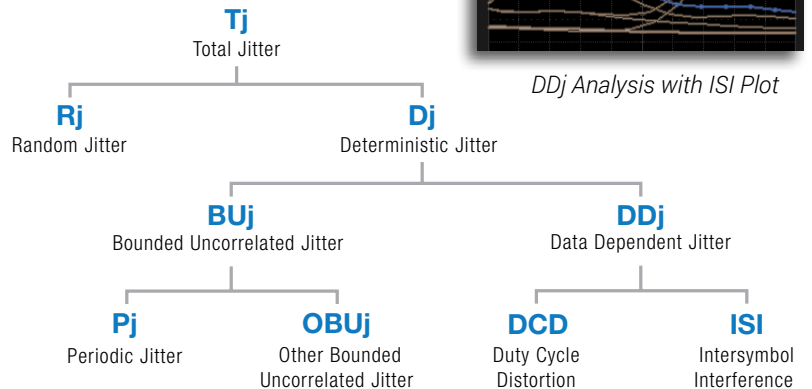

Rj+BUj Analysis

Eye with IsoBER

DDj Analysis with ISI Plot

Pj Analysis

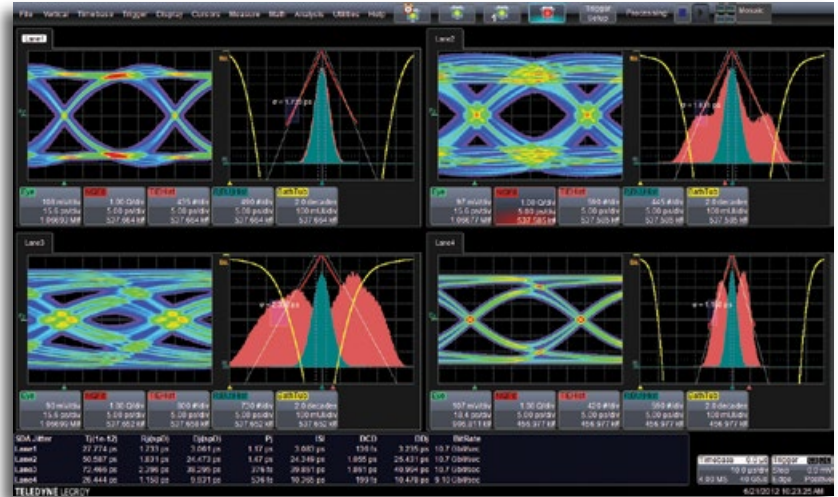

Three Jitter Methodologies

Choose from three dual-Dirac models to separate jitter into total, random and deterministic components (Tj, Rj, Dj). The Spectral Rj Direct method determines Rj directly from the jitter spectrum, and is the most used algorithm. Spectral Rj+Dj CDF Fit follows the FibreChannel MJSQ model. In situations where large amounts of crosstalk/BUj raise the spectral noise floor, the NQ-Scale method will provide more accurate separation of Rj and Dj, and therefore more accurate Tj results.

OPTIONAL SDAIII UPGRADES

Measure up to 4 Lanes Simultaneously

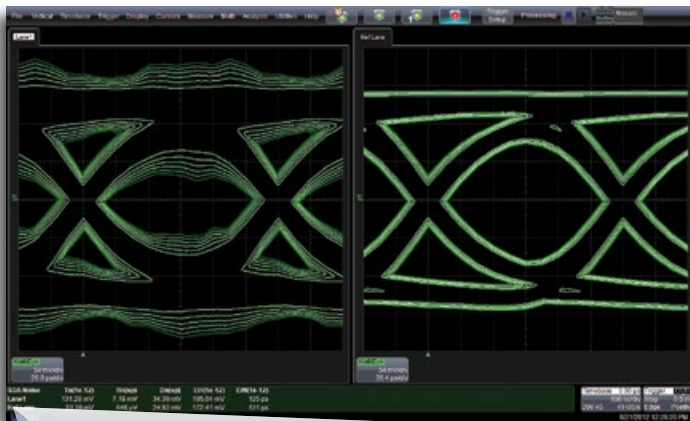

"LinQ" products provide extensive multi-lane analysis capabilities. Quickly understand lane-to-lane differences in jitter measurements, eye diagrams, and jitter analysis. Perform aggressor on/off analysis, and see the results from both scenarios simultaneously. Save the analysis of a particular scenario to the Reference Lane, and configure a LaneScape™ Comparison mode to compare the Reference to either one, two or all lanes. Each "lane" can be a different serial data lane, or a different analysis of data from a single serial data lane - ideal for comparing different equalization schemes (using Eye Doctor II option) or

examining system behaviors at different locations in the lane (using probes or the VirtualProbe option).

Vertical Noise and Crosstalk

The Crosstalk and CrossLinQ packages provide vertical noise measurements and crosstalk analysis tools for

| SDA Noise | Tn(1e-12) | Rn(sp) | Dn(sp) | EH(1e-12) | EW(1e-12) |
|-----------|-----------|---------|----------|-----------|-----------|
| Lane1 | 131.28 mV | 7.18 mV | 34.39 mV | 105.04 mV | 125 ps |
| Ref Lane | 33.38 mV | 646 µV | 24.93 mV | 172.41 mV | 131 ps |

complete aggressor/victim analysis. Use one of three dual-Dirac models to measure and separate noise into total (Tn), random (Rn) and deterministic (Dn) components, and further decompose Dn into Intersymbol Interference Noise (ISIn) and Periodic Noise (Pn). Only Teledyne LeCroy performs this analysis on real-time oscilloscopes. Similar to jitter analysis, noise can be viewed as a noise track, histogram and spectrum, providing insight into the vertical noise resulting from coupling to other active serial data lanes or other interference sources. The Crosstalk Eye shows the probabilistic extent of noise both inside and outside the eye, quickly showing the impact of excessive noise that is not possible to see in a traditional eye diagram.

CompleteLinQ Does it All

The CompleteLinQ user interface framework provides easy access to all features described above, and also integrates EyeDoctorII and VirtualProbe capabilities for Tx/Rx equalization and fixture/channel de-embedding/emulation. Order SDAIII-CompleteLinQ to equip your oscilloscope with all of Teledyne LeCroy's Serial Data Analysis and Signal Integrity tools.

EYE, JITTER AND NOISE ANALYSIS OF PAM4 SIGNALS

PAM4 signaling is seen as the next step in the evolution of serial data signal formats, allowing two bits of information to be transmitted per UI rather than one. Next generation standards from OIF and IEEE including CEI-56G-VSR and 100GBASE-KP4 utilize PAM4 signaling. Teledyne LeCroy's PAM4 analysis package extends our industry-leading eye, jitter and noise analysis capabilities to perform a complete analysis of all three eye openings in a PAM4 signal.

Measure Eye, Jitter and Noise

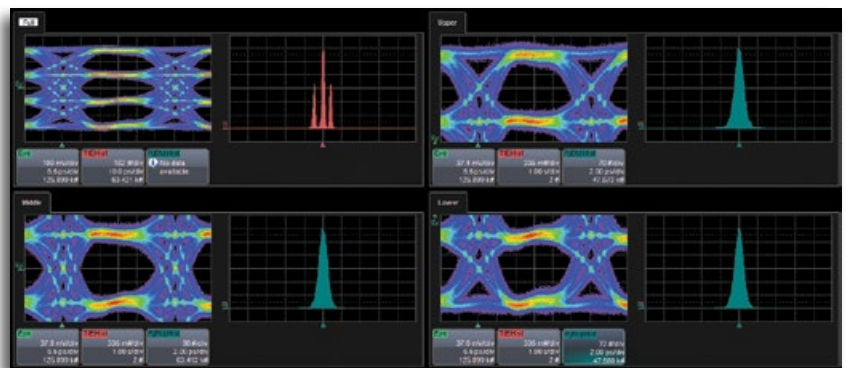

For each of the three eye openings, the PAM4 software package performs a complete analysis to determine the eye openings, jitter and noise as a function of BER. Measurements for each opening include: Eye Height, Width Tj, Rj, Dj, Tn, Rn and Dn. Mean and RMS values for each level are also determined, as well as periodic noise and jitter results.

Deeper Understanding with Additional Views of Jitter and Noise

The PAM4 package includes the views of noise and jitter utilized in the SDAIII-CompleteLinQ package. Enhance understanding of jitter and noise by displaying histograms, spectra, bathtub and IsoBER curves for each eye opening. PAM4 analysis is compatible with EyeDoctorII, allowing users to de-embed channel and fixture effects, emulate a channel, or apply equalization.

EYEDOCTOR™ II AND VIRTUALPROBE SIGNAL INTEGRITY TOOLS

As signal speeds and data rates continue to rise, signal integrity effects such intersymbol interference (ISI) and crosstalk become more prevalent and challenging. Use Teledyne LeCroy's Advanced Signal Integrity tools to transform your measured signal to include the effects of de-embedding, emulation and equalization algorithms.

De-embed, Equalize and Emulate with EyeDoctorII

Curious to know what your signal would look like without fixture effects? Do you need to understand how ISI and crosstalk of a modeled channel will affect your jitter margin? Or are you seeking to determine which equalization schemes will do the best job of opening a closed eye? The EyeDoctorII package includes easy configuration of basic de-embed/emulation scenarios, CTLE, DFE and FFE equalizers, and transmitter emphasis/de-emphasis.

Advanced De-embedding, Emulation and Virtual Probing

The VirtualProbe package expands the de-embedding and emulation capabilities of EyeDoctorII. Configure a multi-block circuit using modeled S-parameters or measured with a Teledyne LeCroy SPARQ (or other VNA), and VirtualProbe will build the transfer function that returns the signal as it would appear before or after any block in the circuit. The electrical behavior of a block to reflect and transmit signals can be included, added or removed in order to de-embed or emulate fixtures or channels. Probe loading effects can also be removed. When used in conjunction with the Crosstalk, CrossLinQ or CompleteLinQ SDAIII options, crosstalk between lanes can be modeled using 8 and 12-port S-parameters. Use the Teledyne LeCroy SPARQ to measure these S-parameters at a fraction of the price of a VNA.

Use EyeDoctorII and VirtualProbe with SDAIII CompleteLinQ products

When using EyeDoctorII and VirtualProbe on oscilloscopes enabled within the SDAIII-CompleteLinQ products, configure de-embedding, emulation and equalization from the same simple flow-chart dialog as all other serial data analysis features. When enabled with the "LinQ" option to enable 4 lanes, users can configure EyeDoctorII and VirtualProbe configurations on each lane, facilitating rapid comparisons of different de-embedding and equalization setups.

DEEP INSIGHT CLARIFIES COMPLEX SIGNALS

All Oscilloscope Tools are Not Created Equal

LabMaster 10 Zi-A has the deepest standard toolbox of any oscilloscope, providing more measure, math, graphing, statistical, and other tools, and more ways to leverage the tools to get the answer faster. While many other oscilloscopes provide similar looking tools, Teledyne LeCroy allows the most flexibility in applying the tools to any waveform.

Customized Tools

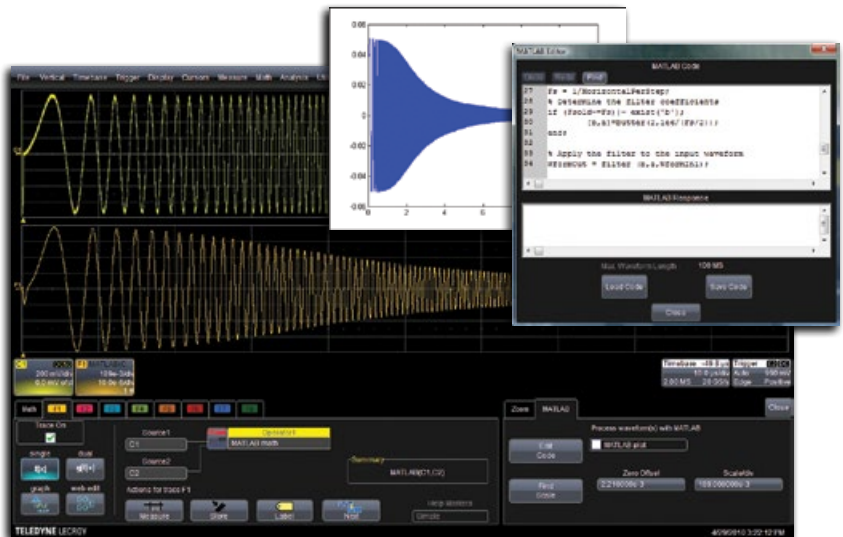

Only Teledyne LeCroy completely integrates third party programs into the oscilloscope's processing stream by allowing you to create and deploy a new measurement or math algorithm directly into the oscilloscope environment and display the result on the oscilloscope in real-time! There is no need to run a separate program, or ever leave the oscilloscope window. Use C/C++, MATLAB, Excel, JScript (JAVA), and Visual Basic to create your own customized math functions, measurement parameters, or other control algorithms.

Graphical Track, Trend, and Histogram Views

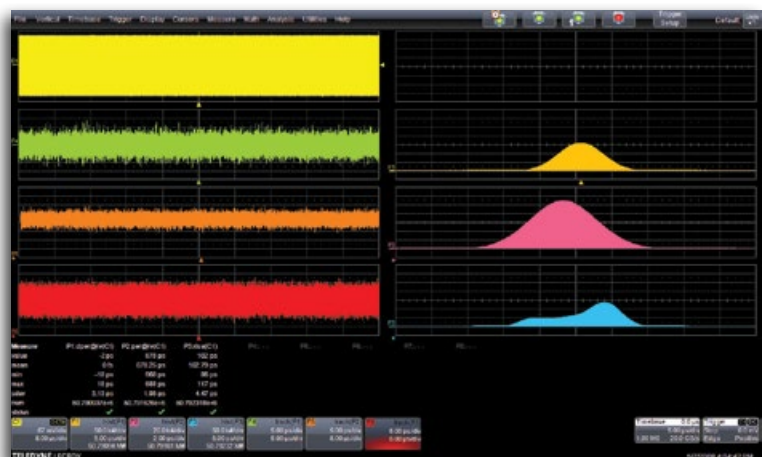

Track plots measurement values on the Y-axis and time on the X-axis to display a measurement change time-correlated to the original channel acquisition—perfect for intuitive understanding of behaviors in frequency modulated (FM) or pulse width modulated (PWM) circuits and jitter measurements, including modulation or spikes. Histograms provide a visual distribution representation of a large sample of measurements, allowing faster insight. Trends are ideal for plotting slow changes in measurement values.

X-Stream II fast throughput streaming architecture makes difficult analysis and deep insight possible. Above, an FFT is applied to a 50 Mpts waveform to determine root cause failure. The high frequency resolution this provides enables deep insight into signal pathologies.

MODULAR DESIGN FOR EXPANDABILITY

LabMaster 10 Zi-A leverages the unique LabMaster ChannelSync architecture with next-generation 8HP SiGe chipsets to produce the world's highest bandwidth, four channel oscilloscope – 36 GHz. When combined with patented DBI technology, bandwidth nearly doubles and triples, to 65 GHz and 100 GHz, with sample rates of 160 GS/s and 240 GS/s.

LabMaster 10 Zi-A oscilloscopes are fundamentally better – they are modular, inherently upgradeable, and infinitely flexible while retaining all the simplicity of operation expected from a conventional oscilloscope. LabMaster 10 Zi-A oscilloscopes can be configured for massive numbers of channels at up to 100 GHz – completely eliminating technology and test barriers.

ChannelSync technology ensures precise synchronization of all channels in all acquisition modules by using a single-distributed 10 GHz clock and a single trigger circuit. External clocking is not required, and trigger jitter from multiple trigger circuits is non-existent. Jitter between all channels is an ultra-low $<130 \text{ fs}_{\text{rms}}$. Conventional 10 or 100MHz reference clocks simply cannot achieve this level of performance. Multi-module synchronization performance is identical to that provided with a single, standard oscilloscope package, and all captured waveforms and analysis appears on one oscilloscope display.

Typical LabMaster 10 Zi-A Systems

The Master Control Module (which includes the display) simply and quickly connects to one or more acquisition modules to create a functional, single oscilloscope package, but without the normal input channel or bandwidth limitations—operation is the same as a conventional oscilloscope. All waveforms are viewable on the built-in 15.3" display or on a variety of optional or user-supplied displays (up to 2560 x 1600 resolution). The entire system design speaks to a level of sophistication and integration not seen before in laboratory equipment.

4 Channels at 36 GHz

The base configuration is a LabMaster MCM-Zi-A Master Control Module and a single Acquisition Module. This provides four channels at up to 36 GHz and 80 GS/s. Acquisition modules are available at 20, 25, 30 and 36 GHz.

4 Channels at 65 GHz

8 Channels at 36 GHz

Build a 4-channel 65 GHz oscilloscope by connecting two acquisition modules. This system can also be used as an 8-channel, 36 GHz oscilloscope. In addition to 65 GHz acquisition modules, 50 and 59 GHz units are available.

The OC910 oscilloscope cart is ideal for housing systems with up to 4 acquisition modules.

Maximum Flexibility

Start with one Master Control Module and one Acquisition Module. Upgrade Acquisition Modules to include more memory or more bandwidth. Add additional acquisition modules at any time without returning equipment to the factory for modification or re-calibration.

Master Control Module

The LabMaster MCM-Zi-A Master Control Module provides the display, control panel, CPU, and ChannelSync 10 GHz distributed clock to provide precise and unmatched synchronization between all oscilloscope channels. High-speed PCIe cables connect to the acquisition modules for control and data transfer. The MCM-Zi-A includes a server-class CPU with Xeon™ E5-2680 v2 processors and 32 GB of RAM standard (up to 192 GB optional). Coupled with Teledyne LeCroy's X-Stream II architecture, the CPU muscles its way through the immense amounts of acquisition data made possible by LabMaster 10 Zi-A.

Additional Acquisition Modules

LabMaster 10 Zi-A acquisition modules are available at a variety of bandwidths, from 20 GHz to 100 GHz. All modules include four channels at 36 GHz bandwidth. The 50, 59, and 65 GHz models also provide 2 channels at the rated bandwidth; the 100 GHz module includes 1 channel. Each acquisition module is tightly integrated to the Master Control Module (MCM-Zi-A) with a ChannelSync 10 GHz distributed clock and two PCIe cables. Up to 20 acquisition modules can be used in one system. All acquired data is sent to the server-class CPU for processing.

ChannelSync Mainframe Hub

Easily expand beyond 5 acquisition modules with the LabMaster CMH-20Zi ChannelSync Mainframe Hub. The CMH-20Zi synchronizes up to 80 channels at 36 GHz with the same <130 fs precise performance as 4-channel system. The hub redistributes the 10 GHz clock and PCIe synchronization signals to up to 20 acquisition modules. One "card" is used for each connected acquisition module; cards can be purchased at any time to minimize the upfront cost.

HIGH BANDWIDTH PROBING SOLUTIONS

Ultra-wideband Architecture for Superior Signal Fidelity

Teledyne LeCroy's WaveLink® high bandwidth differential probes utilize advanced differential traveling wave (distributed) amplifier architecture to achieve superior high frequency analog broadband performance.

Highest Bandwidth (25 GHz) Solder-In Lead

Up to 25 GHz Solder-In performance with system (probe + oscilloscope) rise times equal to that of the oscilloscope alone.

Ultra-compact Positioner (Browser) Tip

The most compact positioner tip browser with bandwidth up to 22 GHz makes probing in confined areas easy.

Superior Probe Impedance Minimizes Circuit Loading

Circuit and signal loading is reduced by more than 50% with WaveLink high bandwidth probes compared to competitive probes. In the mid-band frequency range, the difference is even more apparent.

Superior Signal Fidelity and Lowest Noise

WaveLink has exceptional noise performance. In fact, the combination of the probe and the oscilloscope results in measurement performance that is nearly identical to that of a cable input.

|------------|--|
| Capability | Arm on “A” event, then Trigger on “B” event. Or Arm on “A” event, then Qualify on “B” event, and Trigger on “C” event. Or Arm on “A” event, then Qualify on “B” then “C” event, and Trigger on “D” event |
| Types | Cascade A then B: Edge, Window, Pattern (Logic) Width, Glitch, Interval, Dropout, or Measurement. Measurement can be on Stage B only. Cascade A then B then C (Measurement): Edge, Window, Pattern (Logic), Width, Glitch, Interval, Dropout, or Measurement. Measurement can be on Stage C only. Cascade A then B then C: Edge, Window, Pattern (Logic) Cascade A then B then C then D: Edge, Window, Pattern (Logic), or Measurement. Measurement can be on Stage D only. |
| Holdoff | Holdoff between A and B, B and C, C and D is selectable by time (1ns to 20s) or number of events. Measurement trigger selection as the last stage in a Cascade precludes a holdoff setting between the prior stage and the last stage |
